**a beta-encoded
Font for**

Classical Greek

© Vernon Eugene Kooy 2008

Oxon-Porson Greek is an 8-bit ASCII font meant to imitate the fonts used by Oxford University Press and the writing style of Richard Porson. The font is specifically designed to work as a beta encoding similar to S-Greek distributed by Silver Mountain Software. Rather than using pre-composed characters it allows the user to compose glyphs plus the diacriticals from the keyboard. This requires that several diacriticals are needed for proper placement and the following charts show how they are to be used.

The font should be and is designed to be used by those persons who do not have access to Unicode or a Unicode font, either by virtue of their word processing program or by virtue of their operating system. The user will find that the font imitates the font used by Loeb Classical Library and others as well as beginning Greek textbooks, which use a Porson style of text.

The font also includes a number of diacriticals so that the font can be used for other languages which use the Greek alphabet including Tosk, Aroumanian, Avrantic and the Cypriot dialect. Following Richard Porson upper case glyphs are erect, while lower case glyphs slope to the right. If one would prefer to imitate the text of UBS Novum Testamentum, the uppercase glyphs should be italicized.
